The Connector Emulation Library (CEL) allows developers to create C++ or .NET applications to connect to an Autodesk product. Autodesk offers a programming language called AutoLISP, also known as AutoLISP. AutoLISP was originally developed in the late 1980s as part of the Interactive Design Research (IDR) group at Autodesk. IDR had a vision of a graphical language that was easily learnable, and AutoLISP was a part of this goal. AutoLISP is a procedural programming language. Visual LISP is the last Autodesk language that still is an active product. Visual LISP has been the foundation of some Autodesk products for many years. However, the Visual LISP application has been discontinued. AutoLISP is more in line with more of a "declarative" programming language as compared to Visual LISP. Visual LISP is a more functional programming language. Autodesk is open to the concept of a functional programming language for AutoLISP. An easy way to understand AutoLISP is to think of it as "AutoLISP with a list of procedures" and it has a program structure similar to the Gherkin syntax. The use of the "if" statement is optional as opposed to the "if-then-else" used in most other programming languages. Visual LISP is available for use in all Autodesk products except AutoCAD Mechanical and AutoCAD Architecture. For all three products, AutoLISP is supported. The Visual LISP part of AutoCAD Architecture and AutoCAD Mechanical are more robust than the AutoLISP, providing support for advanced features such as templates, an event system, and macro definitions. AutoLISP and Visual LISP are part of the free Autodesk Architectural Desktop. AutoLISP is also being used in conjunction with Visual LISP

to make the architecture user interface in AutoCAD Mechanical. However, the latest release of AutoCAD Mechanical is the first time AutoLISP has been used to build a completely new user interface for AutoCAD. For this reason, AutoCAD Mechanical is still under development and is not available to the general public. AutoLISP and Visual LISP are part of the free Autodesk Architectural Desktop. Field of the Invention This invention relates to inflatable boat life rafts, and more particularly to such rafts with an inflatable tube having a central area that is separate from the inflatable outer tube. 2. Description of the Related Art Life rafts are commonly used by ships and other craft for emergency survival during times of emergency. Life rafts may be in the form of an inflated tube or a flexible bag filled with air. The inflated tube life raft, sometimes called a xe2x80x9csuperxe2x80x9d raft, can be used in many different kinds of emergencies. The inflated tube life raft is inflatable so that it can be stored deflated and inflated by the user when necessary. This type of life raft has an advantage over a flexible bag life raft because the inflated tube life raft may be inflated more rapidly and requires less storage space. The life rafts used on board a ship are generally provided in the
