Many U.S. manufacturers of bridge components (including structural steel, steel trusses, etc.) had developed their own CAD products for internal use, but lacked the resources to create a comprehensive product to sell to the industry. By the late 1990s, two enterprising companies—NRC Group, a wholly owned subsidiary of the National Research Council of Canada, and 3D Systems—developed versions of their respective proprietary CAD products, using CADD technology developed by the British firm, AutoCAD, to create software that could function as a bridge design application. They decided to create a common bridge design product, which was branded as "AutoCAD." This new product has since been purchased by Autodesk Inc., although the NRC Group continues to develop it. The NRC Group has also licensed AutoCAD to several Canadian universities, which have offered it to their students to use as part of their degrees in civil engineering. Licensing AutoCAD LT is a graphic and database software package for the Windows platform and is distributed free of charge. The tools and features are not the same as the stand-alone professional version. It is therefore considered a "low cost" alternative to AutoCAD. It has since been superseded by AutoCAD LT 2017. Another low cost alternative for AutoCAD is DXFObject, which is available as free software under a dual license. Recent versions of AutoCAD LT can import and export DXF, DWF, DGN, DWT and DXF-based files. AutoCAD LT also provides some limited file conversion. Beginning with AutoCAD 2004, AutoCAD requires a subscription to the AutoCAD 360 family of products in order to be installed and licensed. The standard professional license is AutoCAD LT which also requires a subscription. AutoCAD 2010 and later have the ability to read CAD data and 3D models that have been produced in other CAD packages. The newer a1d647c40b
