The primary difference is that Photoshop is good at manipulating image files. It can create advanced edits like splitting an image into layers and cut and pasting pieces of an image onto separate layers. Lightroom, on the other hand, is a good basic image editing tool for reducing, correcting, and refining images. Lightroom keeps the original image file — not a duplicate version created in Photoshop — and is also often used as a starting point for creating Lightroom projects. The following figure shows some post-processing images created in Photoshop and Lightroom. * * * # Learn Photoshop by Using Lightroom Lightroom is not a tool for just basic image editing. It's a powerful image analysis and editing tool that allows a photographer to easily search and organize his or her digital photos. It also allows you to prepare images for printing, web use, presentations, and more. Lightroom also enables you to create interactive guides and be guided with the range of easy-to-use tools to complete digital transformations. The tools are simple to use, and you can vary the level of the editing through a large range of settings that go beyond the editing tools in the image-editing toolbox. * * *
