Effects of some metabolic inhibitors (2,4-dinitrophenol, oligomycin, dinitrophenol + oligomycin and NaCN) on carbamylcholine-induced arrhythmogenic effects have been studied in the experiments on the isolated sino-atrial node of the rabbit. The results have shown, that carbamylcholine causes a quick (during 30-60 sec) and significant (P less than 0.01) decrease of sino-atrial node of excitability, that was completely reversible after the end of carbamylcholine action. The metabolic inhibitors (in the doses used) were ineffective, if the administration was done before or after the effects of carbamylcholine, and they inhibited the effects of carbamylcholine only when the drugs were added to the perfusion medium at the same time as the drug.Q: unable to import certificate from windows store I am trying to import a certificate generated in windows store, but getting below error while doing so.
