Field of the Invention This invention relates to a rotary switch, and more particularly to a rotary switch having an improved operating knob. 2. Description of the Prior Art Rotary switches are commonly used in industry to selectively activate various equipment and control many processes. The knob of a conventional rotary switch is often arranged on the top surface thereof so that a hand may be inserted into the switch to actuate the knob. However, these switches are frequently times out of reach of the operator. The aforementioned difficulty can be solved by providing a rotary switch with a knob that is mounted in a recess in the top of the switch. For example, U.S. Pat. No. 2,941,084 to Meyers, Jr. teaches a rotary switch having an actuator that is disposed in a recess in the top of the switch. However, many users of such switches find it preferable to have the knob arranged in a vertical manner and, thus, inconvenient to reach. The switch disclosed in U.S. Pat. No. 2,941,084 still has the disadvantage that the knob cannot be operated with a hand without first removing it from the recess. Accordingly, there is a need for a rotary switch having a knob arranged in a vertical orientation and which is easily accessible without first removing the knob. WASHINGTON—On Monday, three Democratic members of Congress signed a letter to the FDA demanding the agency reconsider the enforcement action it brought against Clorox. After a February inspection of the company's manufacturing facility in Pasadena, California, the agency issued a scathing report, accusing the company of "lax internal controls" that allowed lead to leach into its bleach
