Key Concepts A drawing, or model, is represented as a set of elements. These elements are objects which contain geometric data. Elements can be categorized by their properties. The properties of elements in the same category are similar. For example, elements which have the same dimension are similar. Structure of an object Objects have geometric information called attributes. The location of the object and the dimensions of the object can be expressed as a 3D position and a 3D size, respectively. The attributes of an object are the parameters that can be used to control the behavior of the object. For example, the scale of an object can be changed to change its size. Attributes of objects can be numeric or categorical. For example, the thickness of a line can be measured with a numeric value, which is called the thickness of the line. Alternatively, the thickness of the line can be expressed as a binary value, which is called the thickness of the line. Numeric attributes can be translated to a binary value and the binary value can be translated to a numeric value. Therefore, a numeric attribute is internally represented as a binary attribute. Attributes of an object are divided into logical attributes, which are attributes that are always present, and optional attributes, which are attributes that are specified only when the object is selected. Modes An attribute can have a mode. A mode of an object is one of the attributes that determine how an object behaves. For example, the mode of a line is the thickness of the line. The type of a mode is one of the properties of a mode, which determines the behavior of the mode. For example, thickness of a line is a numeric type and this indicates that the line is measured with a numeric value. All objects have a default mode. Structure of the drawing A drawing consists of blocks of objects, which are elements in a drawing. A block of objects is a group of objects. The size of a block is called the block size. A block may contain only a single object. However, a block can contain multiple objects. A single object is called a component of a block. A component of a block is always one of the objects that form the block, such as a line, circle, spline, polyline, 3D surface, etc. Attributes An attribute of an object represents the data and behavior of the object. Attribute can be numeric or categorical. Attribute can a1d647c40b
