The AutoCAD Crack Keygen industry has seen rapid growth over the past 30 years, and the market is projected to grow at a compound annual rate of 6% between 2010 and 2020. The AutoCAD market is expected to grow from \$715 million in 2010 to \$922 million in 2020, and the total addressable market is estimated to grow from \$11.4 billion in 2010 to \$12.1 billion in 2020. AutoCAD competes with two other major commercial CAD systems: MicroStation by Bentley Systems and Fusion 360 by Autodesk. These two programs have different audience segments, but they are similar in some ways. For example, both are based on the Windows operating system and run on the same hardware. MicroStation and AutoCAD are based on different versions of AutoLISP (Autodesk's version is AutoCAD Lisp), a programming language that was designed specifically for CAD. MicroStation is a two-dimensional (2D) drawing program and data management system. The two programs are cross-platform, meaning that they can run on either Windows, macOS, or Linux. Each of the three CAD programs is classified as a vector-based or raster-based software program. Vector-based CAD programs create a drawing using lines, curves, arcs, and text. Raster-based CAD programs create a drawing using polygons, raster tiles, and primitives (such as circles, squares, or triangles). This article compares AutoCAD 2020 and MicroStation 12, reviewing their features and capabilities. We start by comparing AutoCAD's vector and raster capabilities. We then cover AutoCAD's desktop editing tools. This includes tools for applying and modifying styles and brushes, creating cross-references, drawing measurements, and updating objects in multiple views. We conclude with the integration of these tools with AutoCAD's drawing automation capabilities. Vector and Raster Drawing Features In vector-based CAD applications, creating a 2D drawing involves a sequence of three steps: (1) defining the shape (2) converting the shape into a path, and (3) applying a stroke and fill. This process is repeated until all the shapes are complete. Vector-based CAD programs usually have two main display windows. The first window displays the shapes in a hierarchy, and the second window displays the path. The path is displayed as a series of line segments or, in some programs, as a path outline. Raster-based CAD programs
