Note The following pages tell you how to use Photoshop like a pro. You don't have to be a pro to use Photoshop to create simple, attractive images. Sure, they're not Pulitzer-Prize winning images, but they sure do look good. ****Editing photos: It's all here:**** Photoshop is a premier tool for creating, converting, and editing images. You'll find everything you need to get out of a photo that would normally take a long time or put it all in your head. So if you want to create a photo to give to your boss or a friend, this feature can also apply many effects to an image, transform the subject, or do all sorts of things. **## The Organizer**

Every Photoshop program has a `_workspace_` (file folders) folder. In older versions of Photoshop, you accessed the workspace folder by selecting ****File**** and then choosing ****Open**** and navigating to the workspace folder. In a `_workspace_` is where you keep all your files, including layers, your image files, masks, and so on. Also, the workspace folder stores some temporary files such as layers that you create while editing an image. You can also keep your documents in any of the other folders inside your Pictures folder—for example, the Camera Roll or another folder—instead of the workspace. For more on Organizers, see Organize Files for the Easy Way.

Truncated parvovirus B19 DNA in a patient with pure red cell aplasia. The authors present the case of a woman with pure red cell aplasia (PRCA) associated with truncal granulocytopenia with fragmented B19 VLPs. Serologic studies were nonspecific, but B19 DNA was detected in the patient's PBMC by PCR. Sequencing of the PCR product demonstrated a truncation of the left terminus of the genome. No other viral/cellular contaminant was identified. The patient was treated with immunosuppressive therapy and transfusion of multiple units of packed red blood cells (PRBC). After one transfusion, she had resolution of her PRCA. Analysis of the patient's PBMC revealed a clonally expanded population of T cells, CD57(+)CD5(+)CD8(+)CD3(+)CD45RA(+)CD4(+)CD19(-) by 4-color flow cytometry. Proliferative response to pokeweed mitogen was positive, and staining with anti-CD4 was negative, indicating an unusual in vivo regulatory T cell phenotype. Expression of CD27 and CD28 on the T cells was markedly down-regulated. This case demonstrates that the presence of B19 DNA, even in a PRCA, may be associated with the development of PRCA. The T cell phenotype was unusual in the patient and requires further characterization.Q:
