This study examined the association between growth during childhood and cognitive performance in adulthood among 511 male and female twins, assessed on two occasions, at age 30 and again three years later, at age 33. We used robust structural equation modeling to test the association between childhood growth and cognitive change from age 30 to age 33. We found that greater childhood height predicted better performance on two spatial and one verbal test of cognitive function in adulthood, after adjusting for childhood intelligence quotient, adolescent and current IQ, education, and current height. There was no effect of childhood weight or BMI on adult cognitive performance. Our results suggest that height gain in childhood may be a key factor for preventing adverse cognitive consequences of earlier growth, highlighting the importance of childhood nutrition.07/24/2018 Healthy Living For a limited time, Amazon.com is giving away complimentary Kindle Fire 7 Kids Edition tablets with a 10% discount to encourage the next generation to get started with reading.
